

As hygiene standards increase, YongSeal technology can seal the edge of the belts completely and bring new characteristics to your application as follows:

- Prevent latitudinal fiber pull out.
- Avoid belt edge contamination.
- Better belt strength and stretch after long time using.
- Longer belt service time.
- Lower running costs.
- Easy to clean.
- Improved belt image.

YongSeal® belts are widely used for Food, Electronic, Tobacco, etc. industries which need high requirement for environmental hygiene and other special requirements.

Belt edges of conveyor belts are normally finished with cut edges and are not protected against external influence. YongLi edge capped concept can protect the belt edges of whole roll material.

YongSeal® technology

Before closed edge: Standard products.

In process: Fabric layer will be eliminated.

Final products: YongSeal can guarantee that the belt edge will bond with the belt itself completely without seam as a homogeneous unit.

YongSeal technology can be applied on different kinds of materials, such as PVC, PU and Hytrel belts.

Please inquire.

YONGLI Profiles

Guideropes, Cleats, Sidewalls Foils and YongSeal®

On the basis of close interaction with engineers and customers, YongLi developed different kinds of accessory parts. Guideropes, Cleats, Sidewalls, Notched guiderope and Yongseal closed edge, which would be able to meet the different requirements for efficient conveying applications.

YongLi also would like to make relevant researches and develop new kinds of profiles under the close cooperation with customers. For further information, please contact our salesman.

Due to the different kinds of materials, conveying environment and the weight of the goods every application situation will be different. Yong Li will be pleased to help you with your choice by giving suggestions and make relevant laboratory tests according to the given information and samples.
